W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose sequence 614 AA;
                                                                                                   DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English.
This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                N-PSDB; Q35992.

Chis sequence represents a fused protein recognised by pemphigus follaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus follaceus is antigen protein through the hinge portion. Pemphigus follaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus follaceus antigen fusion protein is useful to treat pemphigus follaceus. The antigen is especially administered through an adorbent upon which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphigus follaceus antibodies which is useful infumunocalismosis. The fusion protein has little or no side effects.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peplomer protein or S (Spike), of bovine coronavirus (BCV). It is a mol.wt. of 150 kDa exclusive of glycosylation and contains 21 potential N-linked glycosylation sites. The amino acid sequence was deduced from an clone E2 cDNA (see T89387). The 22 gene in plasmid pri8E2 (E. coli JM105) is deposited as ATCC E2 gene in plasmid pri8E2 (E. coli JM105) is deposited as ATCC 68041. The BCY E3 gene (see T89388) is immediately 5' of the E2 component the E2 initiation codon. The E2 and E3 genes have been continued and can be used for the recombinant production of BCY polypeptides, using e.g. Spodoptera frugleperda sf9 insect cells as host cells. Glycosylated and non-glycosylated recombinant can be useful as components of vaccines of irected toward preventing BCY infection, or reducing the severity of BCY infection, in bovine populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The human E-cadherin protein precursor (R85487) is expressed by an cDNA clone (T05764) derived from human liver. The extracellular an cDNA clone (T05764) derived from human liver. The extracellular domain of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphocytes to E-cadherin-expressing epithelial or endothelial cells in vitro or invo, thereby modulating mucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to E-cadherin and that can inhibit T-cell binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human E-cadherin precursor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          uvomorulin, L-CAM and Cell CAM 120/80. The DNA encoding hEC was obtd. by screening normal human liver and hepatocellular carcinoma cDNA clibraries and a colonic epithelial cell cDNA library. The following sequences are specifically claimed: AAS 1-878; 131-878; 30 sequential AAS from AAS 308-878; AAS 1-150; AAS 178-289; AAS 290-401; AAS 402-513; AAS 178-513; AAS 151-703; AAS 17-703; AAS 728-878; CAAS 704-878; nucleotide sequences comprising nucleotide numbers 116-2749; 566-2749; 1-1053; 510-2696; 1332-3000; 540-1500; 348-906; 890-1648; 384-1208; 641-2046; 685-1335; 880-1661; 1199-1742; 1373-1742; C1705-2204; 2458-2775; DNA encoding at least 30 AAS selected from AAS 308-878. The prods. can be used in the diagnosis, prognosis, therapy and prophylaxis of conditions involving improper E-cadherin expression. Suitable dosages for i.v. admin. of a protein are 50-500 mcg/kg body wt.
                                                                                                                                                                                                                                                                                         Query Match

Claim 2; Fig 1f; 20pp; Japanese.

DNA encoding the protein can be inserted into an expression vector for the prodn. of MG-1 polypeptide which elicits an antigen-antibody reaction with anti-mycoplasma gallisepticum poultry sera. It may also be lighted to other DNA to produce fusion proteins with an N-terminal

Claim 1; Column 25-28; 22pp; English. This sequence represents the human Trabecular meshwork induced glucocorticoid response (TIGR) protein. The TIGR protein is a secretory protein specifically bound by the antibody of the invention. The antibody, especially in labelled form, can be used in the diagnosis of glaucoma by detecting elevated levels of the protein in the trabecular meshwork of the eye. Using the antibody, glaucoma is detected more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pea seeds lacking plastidial phosphoglucomutase activity - have higher sucrose levels at end of vining period and can be vined over extended period compared to conventional varieties Disclosure; Page 58-62; 83pp; English.

This protein comprises pea plastidial phosphoglucomutase (PGM(p)), an enzyme that catalyses the interconversion of glucose-1-phosphate and glucose-6-phosphate, and is thus involved in starch synthesis. The amino acid sequence was deduced from an isolated cDNA clone (see, V00731) and shows considerable homology to known PGM sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides pea plants that have substantially reduced PGM(p) activity or which substantially lack PGM(p) activity. This may be the result of antisense or sense suppression technology. Pea seeds from such plants have higher sucrose levels at the end of the vining period and may be vined over an extended period compared to conventional varieties. The invention provides pea seeds having a sucrose content of over 6% of total weight, and a ratio of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Harrison CJ, Hedle WPI; 98-101065/09. PT New isolated glaucoma-associated nucleic acids - which encode
PT Trabecular Meshwork Induced Glucocorticoid Response protein, used to
PT develop products for diagnosing glaucoma-related diseases
Claim 1; Fig 1; 22pp; English.
CC The present sequence is a human secretory protein from clone II.2.
CC The present sequence is a human secretory protein shighly induced by
CC Glucocorticoid Response) protein. The protein is highly induced by
CC glucocorticoid Response) protein in the protein shighly induced by
CC glucocorticoid Response) protein and proteins can be used as markers
CC for the diagnosis of glaucoma, primary open angle glaucoma (POAG),
CC gigmentary glaucoma, and low tension glaucoma and their related
CC diseases. They can also be used to diagnose or protect an individual's
CC sensitivity to elevated intraocular pressure upon administration of
CC steroids such as glucocorticoids or corticosteroids. These products can
CC also be used for diagnosing other diseases or conditions that affect the
CC expression or activity of the protein. The products can also be
CC formulated for administration to patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

products for diagnosis, prognosis and treatment of glaucoma Claim 48; Fig 8; 105pp; English.

This sequence represents a novel human trabecular meshwork induced glucocorticoid response protein (TIGR) which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and within TIGR exons can also be used to diagnose glaucoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human trabecular meshwork induced glucocorticoid response protein.

DISEASE: PEMPHIGUS VULGARIS (PV) IS A POTENTIALLY LETHAL SKIN DISEASE IN WHICH EPIDERWAL BLISTERS OCCUR AS THE RESULT OF THE LOSS OF CELL-CELL ADHESION CAUSED BY THE ACTION OF AUTOANTIBODIES AGAINST DSG3.

SIMILARITY: BELONGS TO THE CADHERIN FAMILY. BELONGS TO THE DESMOSOMAL SUBFAMILY.

PROC. NATL. ACAD. SCI. U.S.A. 88:4796-4800(1991).

-!- FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS. INVOLVED IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDI FILAMENTS MEDIATING CELL-CELL ADHESION.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- SUBCELLULAR LOCATION: TYPE TONGUE, TONSILAND OESOPHAGUS.

-!- TISSUE SPECIFICITY: EPIDERMIS, TONGUE, TONSILAND OESOPHAGUS.

SUBMITTED (JUL-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

-I- FUNCTION: COMPONENT OF THE ADAPTOR COMPLEXES WHICH LINK CLATHRIN TO RECEPTORS IN COATED VESICLES. CLATHRIN-ASSOCIATED PROTEIN COMPLEXES ARE BELIEVED TO INTERACT WITH THE CYTOPLASMIC TAILS OF MEMBRANE PROTEINS, LEADING TO THEIR SELECTION AND CONCENTRATION.

AP50 IS A SUBUNIT OF THE PLASMA MEMBRANE ADAPTOR (POTENTIAL).

-I- SUBUNIT: ASSEMBLY PROTEIN COMPLEX 2 (AP-2) IS AN HETEROTETRANBER COMPOSED OF TWO LARGE CHAINS (ALPHA AND BETA), A MEDIUM CHAIN (AP50) AND A SMALL CHAIN (AP17) (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: COMPONENT OF THE COAT SURROUNDING THE CYTOPLASMIC FACE OF COATED VESICLES IN THE PLASMA MEMBRANE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-NOV-1995 (REL. 32, CREATED)

-1- FUNCTION: THIS IS A SEED STORAGE PROTEIN.
-1- SUBUNIT: HEXAMER; EACH SUBUNIT IS COMPOSED OF AN ACIDIC AND A BASIC CHAIN DERIVED FROM A SINGLE PRECURSOR AND LINKED BY A DISULFIDE BOND.
-1- SIMILARITY: BELONGS TO THE 11S SEED STORAGE PROTEINS (GLOBULINS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright.
